Lecture 23:

## Global Bayesian Optimization

---

Announcements:

- HW b covers lectures 21-23; due on Fri May 2

problem:

find  $\underline{x}^* = \underset{\underline{x}}{\operatorname{argmax}} f(\underline{x})$

given

- we can evaluate  $f(\underline{x})$  at any  $\underline{x}$
- evaluating  $f(\underline{x})$  takes time / money
- we cannot evaluate  $\nabla f(\underline{x})$
- dimensionality of  $\underline{x}$  is not very high ( $< 8$ )

**Bayesian Approach:** sequential information acquisition for optimization. A decision making strategy to decide where to evaluate the function next

use a one-step-look ahead information acquisition policy:

(1) start with data set of  $n_0$  input-output observations

$$D_{n_0} = (\underline{x}_{1:n_0}, \underline{y}_{1:n_0})$$

(2) For  $n = n_0, n_0+1, \dots$

a) use current dataset to build a regression model for  $f(\underline{x})$ , eg Gaussian process regression

$$f(\cdot) | D_{n_0} \sim p(f(\cdot) | D_{n_0})$$

b) pick the most important point to evaluate next by maximizing an acquisition function  $a_{n_0}(\underline{x})$  which depends on our current state of knowledge

b) pick the most important point to evaluate next by maximizing an **acquisition function**  $a_n(\underline{x})$  which depends on our current state of knowledge

$$\underline{x}_{n+1} = \operatorname{argmax}_{\underline{x}} a_n(\underline{x})$$

Pick pt  
w/ max  
value or  
info or

$$\text{and } a_n(\underline{x}) \geq 0$$

c) If this max value  $a_n(\underline{x}_{n+1}) \leq \varsigma$ , some threshold, then we stop. We are done.

d) Otherwise, we evaluate  $y_{n+1} = f(\underline{x}_{n+1})$

e) Add new data point to our data set

$$D_{n+1} = ((\underline{x}_1, \underline{x}_{n+1}), (\underline{y}_1, y_{n+1}))$$

f) use Bayes' Rule to update our state of knowledge:

$$f(\cdot) | D_{n+1} \sim p(f(\cdot) | D_{n+1})$$

$$\propto p(y_{n+1} | x_{n+1}, f(\cdot)) p(f(\cdot) | D_n)$$

rebuild  
your  
model  
w/ full  
dataset

g) continue loop (until you are satisfied or run out of evaluation budget)

3) Report your current state of Knowledge about the maximum of the function, eg the **observed maximum**

index of  
obs. max

$$i^* = \operatorname{argmax}_{1 \leq i \leq n} y_i \Rightarrow \max_{1 \leq i \leq n} y_i \text{ at } x_{i^*}$$

Common acquisition functions:

- maximum mean {bad}
- max upper interval
- probability of improvement
- expected improvement
